Total error band

The graph opposite shows the maximum deviation across the entire medium temperature range (-20…125 °C, optional: -40…125 °C).

Within the compensated pressure and temperature range, the total error has a maximum value of 0,25 %FS (-20…85 °C)

Experience shows that outside the compensated temperature range, total error increases linearly by 0,04 %FS/K.

Compensated Temperature:
This is the temperature range within which the product will produce an output proportional to pressure, while remaining within the specified performance limits.

Operating Temperature:
This is the temperature range within which the product will produce an output proportional to pressure, but it may not remain within the specified performance limits.

Storage Temperature:
This is the temperature range within which the product can be safely stored without pressure applied or power input, while still maintaining its rated performance. Exposure to temperatures beyond this range may cause permanent damage to the product.

All configurations are designed with protection against reverse supply voltage and output short circuits.
